1 HOW TO USE THIS MANUAL

To facilitate *use* of the manual, customers may find the following useful:

Call-outs

Callout column:

Callouts on the topics described are placed to the left of the text to allow the user to find the desired information quickly.

Cross references

Cross references:

All the words in *italics* are listed in the index with a reference to the page where they are described in more detail; the text below serves as an example:

"activation of the alarm stops the compressors"

The italics indicate that under Compressors in the index there is a reference to the page where compressors are described in more detail.

If the online Help on the PC is used, the words in italics become proper hyperlinks (automatic links activated with a click of the mouse) that connect the different sections in the manual and allow you to navigate through the document.

Highlighted icons

Some parts of the text are highlighted in the callout column using icons that have the following meanings:

Note: draws attention to a specific topic that users should take into account.

Tip: highlights a suggestion that helps users to understand and *use* the information on the topic described.

Warning! : highlights information that may damage the system or place persons, equipment, data, etc at risk if not known. These sections must always be read prior to *use*.

2 ENERGY XT SERIALS UART

UART serials

Energy XT has two UART-type communication ports indicated with the names *COM1* and *COM3*.

COM1

COM1:

An RS485-type serial with RS485+, RS485- and RS485GND signals

COM3

COM3:

An RS232-type serial with TX, RX, CTS, RTS and DTR (fixed) signals. It is accessible, albeit with different procedures, through a DB9 connector and a MOLEX-type connector (located next to COM4) that "receives" only TX, RX and RTS signals on a TTL electric level.

"Parameters" table COM1 and COM3:

Given below is the list of *parameters* necessary to set the *COM1* and *COM3* serials:

Label	Modbus address [DEC]	COM1 AND COM3 PARAMETERS	Description
Cm24	39191	<i>COM1</i> type protocol	<i>COM1</i> serial protocol selection: 2= <i>Micronet</i> 3= <i>Modbus</i> /RTU
Cm25	39192	BAUD <i>COM1</i>	<i>COM1</i> serial baud selection: 0 = 9600 b/s 1 = 19200 b/s 2 = 38400 b/s
Cm26	39193	<i>COM1</i> parity	<i>COM1</i> parity selection 0 = none 1 = odd 2 = even
Cm27	39194	<i>COM3</i> Protocol Type	<i>COM3</i> protocol selection 0 = Televis 1 = Televis Modem 2 = <i>Micronet</i> 3 = <i>Modbus</i> /RTU 4 = <i>Modbus</i> /ASCII
Cm28	39195	BAUD <i>COM3</i>	<i>COM3</i> baud selection 0 = 9600 b/s 1 = 19200 b/s 2 = 38400 b/s
Cm29	39196	<i>COM3</i> parity	<i>COM3</i> parity selection 0 = none 1 = odd 2 = even
Cm30	39197	Data Length <i>COM3</i>	Selection 7/8 data bits <i>COM3</i>
Cm31	39198	Disable RTS COM2	0=normal management, 1=always high for feeding RS232-RS485 external converters

N.B.: Further information on *parameters* is given in the *parameters* table in section 5.

Important: serial *parameters* must be set as modus protocol.

The card address is unique for serials COM1 and *COM3*.

It is a byte comprising 2 parts:

- The MSB nibble is the device family and also a parameter stored in EEPROM (par. Cm01 with default 0);
 - The LSB nibble is the address of the device read by the three dip switches DIP 2,3,4:
 - E.g. if J2=ON, J3=OFF, J4=OFF the LSB nibble will be equal to 1
 - E.g. if J2=ON, J3=ON, J4=OFF the LSB nibble will be equal to 3
- N.B.:** See the example provided and section "8.1.1.2 Hardware Address"

2.1 Serial "COM1" (RS485)

2.1.1 Use

This serial can be used to connect Energy XT to the outside world.

The serial cannot be used to carry out operations on the internal and external microcontroller flash.

Packets are not spontaneously issued by this serial, but only frame response packets received according the protocols given below.

The communication speed and parity will be manageable within the possibilities of the microprocessor, HW and protocol used.

The communication speed and parity will be manageable within the possibilities of the HW and protocol used.

2.1.2 Protocols Usable on “COM1”

ELIWELL protocol

ELIWELL protocol
 For details on how to use Tool ParamManager
 --> refer to the Param Manager manual for further information

MODBUS

MODBUS
 For connection of the instrument as a SLAVE-type peripheral to an RS485 network containing any HOST MODBUS (also on PC) as host MASTER. The MODBUS protocol will only be RTU-type with fixed baud/rate of 9600 b/s

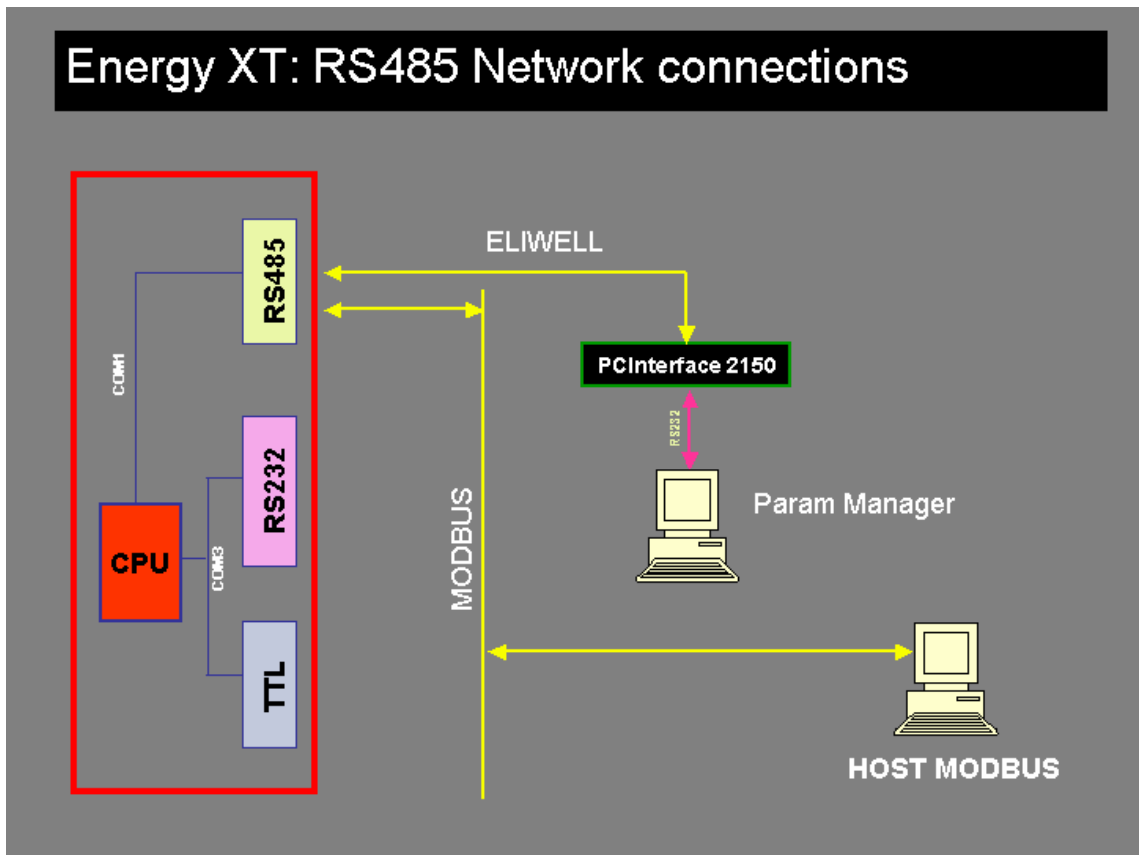

Micronet

To connect the instrument as a SLAVE to an RS485 network containing TelevisCompact, Televis (via EWTK), Qlink and ParamManager as MASTER host. No RVD.

2.1.3 COM1 PARAMETERISATION (parameters in EEPROM highlighted)

	ModBUS/RTU
COM1 type protocol	3
COM1 BAUD	9600
0 : 9600 b/s	
1 : 19200 b/s	
2 : 38400 b/s	
COM1 PARITY	hot
0 : null	x
1 : odd	x
2 : even	x
COM1 DATA	8
7 : 7 data bits	
8 : 8 data bits	
COM1 STOP	auto (*)
1 : 1 stop bit	x
2 : 2 stop bits	x

2.1.4 Local RS485 topology

2.2 COM3 (RS232 / TTL) serial

2.2.1 Use

This serial can be used to connect Energy XT to the outside world.

This serial has a "slave" function but can also spontaneously issue data packets. A typical example, in the case of *MODEM management*, is the initialisation string of the same. The types of MODEM supported are "standard" with RS232-type serial connection (MODEM 485, MODEMFAX Class 1 or 2, are not implemented) and PTSN and GSM type (for remote programming only).

The communication speed and parity are manageable by parameter.

2.2.2 Protocols Usable on "COM1"

ELIWELL protocol

ELIWELL protocol

For details on how to *use* Tool ParamManager

--> refer to the Param Manager manual for further information

MODBUS

MODBUS

To connect the instrument as a SLAVE

- to a local network containing a *MODBUS* HOST on PC as a MASTER host.
The *MODBUS* can be RTU (fixed baud at 9600 b/s) or ASCII
- to a MODEM for remote communications with a *MODBUS* HOST on currently unidentified PC. NB: This works only if *MODBUS*/ASCII is used

2.2.3 COM3 PARAMETERISATION (parameters in EEPROM highlighted)

	<i>ModBUS</i> /RTU	<i>ModBUS</i> /ASCII
<i>COM3</i> type protocol	3	4
<i>COM3</i> BAUD	9600	9600
0 : 9600 b/s		
1 : 19200 b/s		
2 : 38400 b/s		
<i>COM3</i> PARITY	hot	hot
0 : null	x	x
1 : odd	x	x
2 : even	x	x
<i>COM3</i> DATA	8	8
7 : 7 data bits		
8 : 8 data bits		
<i>COM3</i> STOP	auto (*)	auto (*)
1 : 1 stop bit	x	x
2 : 2 stop bits	x	x

NOTE (*)

for default *COM3_STOP* = 1, but:

if (*COM3_PROTOCOLTYPE* = *Modbus*/RTU and *COM3_PARITY* = null)
then *COM3_STOP* = 2

if (*COM3_PROTOCOLTYPE* = *Modbus*/ASCII)
then

if (*COM3_PARITY* = null and *COM3_DATA* = 7)
then *COM3_STOP* = 2

otherwise *COM3_STOP* = 1 /* (parity even and odd with data 7)
or (data 8 with any parity)*/

N.B.: For Modem-based communication with a *Modbus*/ASCII protocol, proper function is guaranteed for the majority of modems if 1 stop, 8 data, parity null and 1 stop. For other settings, check if the modem supports the data format.

2.2.4 MODEM management

A MODEM can be connected on the *COM3* (RS232) for the fixed telephone network.

The following is the list of *parameters* regarding the MODEM set-up for Energy XT:

Label	Modbus address [DEC]	MODEM CALL PARAMETERISATION	Description
Cm09	39176	Enable Modem	Enable modem
Cm10	39177	Modem initialisation string 1	Modem initialisation string (first part)
Cm11	39178	Modem initialisation string 2	Modem initialisation string (continuation)
Cm12	39179	Modem "Hangup" string	Modem hangup string
Cm13	39180	Telephone number	Modem call telephone number

N.B: Further information on *parameters* is given in the *parameters* table in section X.

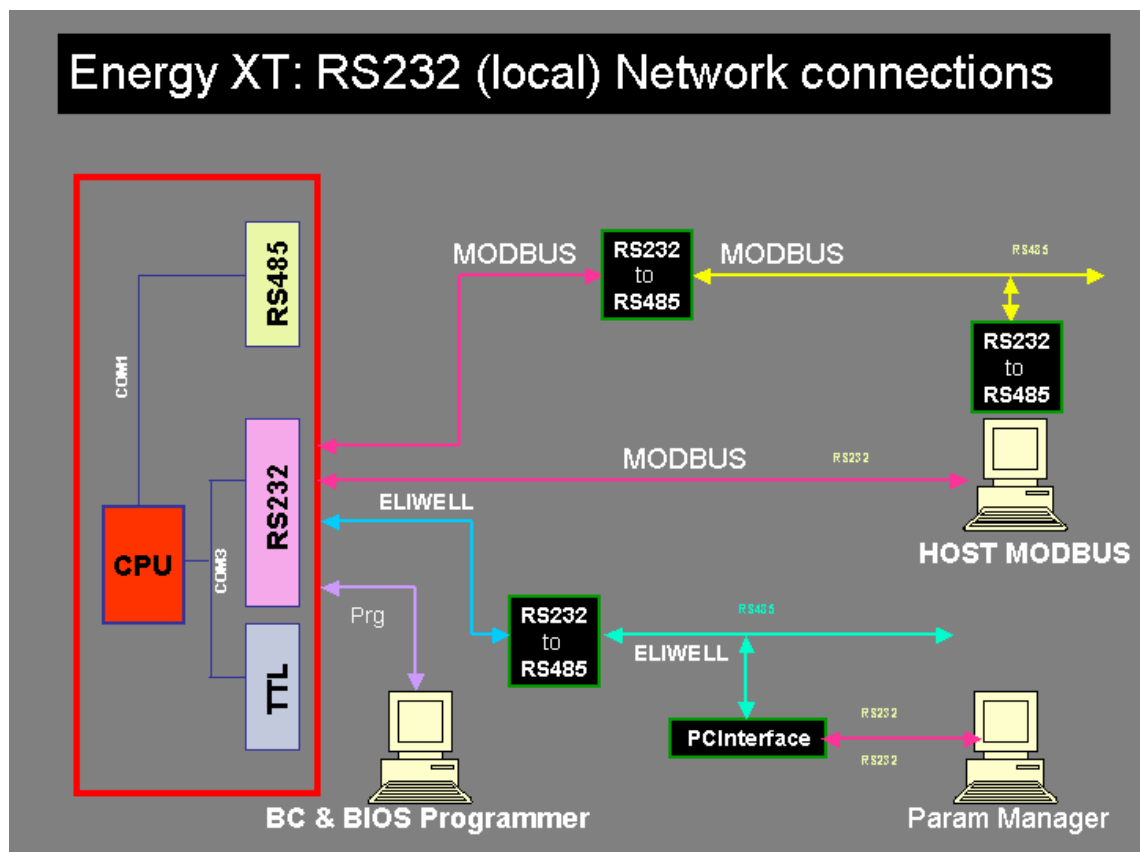

An example of an initialisation string would be AT&F&C1&D2E0X1S0=0&N6 and hangup ATH0.

An example of setting the NUMERO_TELEFONO (telephone number) string; to call the telephone number 655/155555 from a touchtone line, write ATDT65515555, for pulse dial lines write ATP65515555.

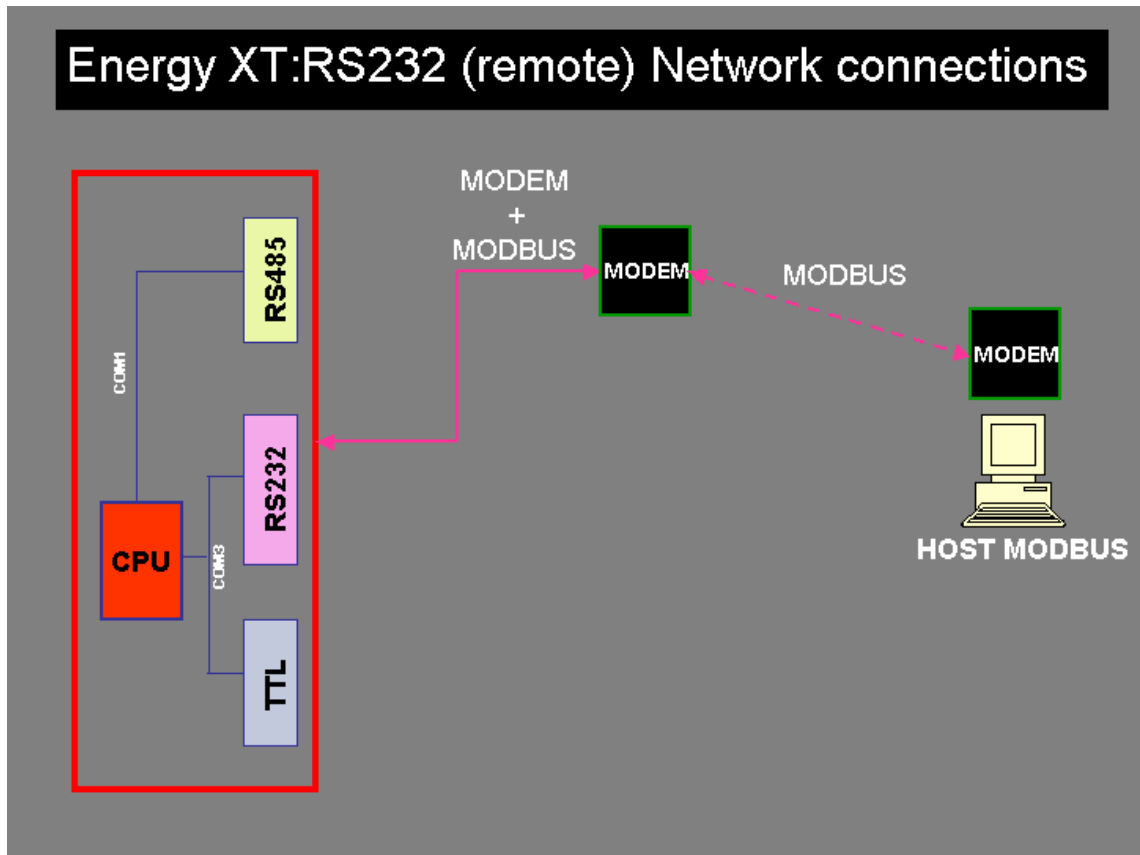

List of some MODEM/FAX devices and GSM used:

- 3COM U.S.Robotics 56K Message Modem
- 3COM U.S.Robotics 56K FaxModem

2.2.5 Local RS232 topology

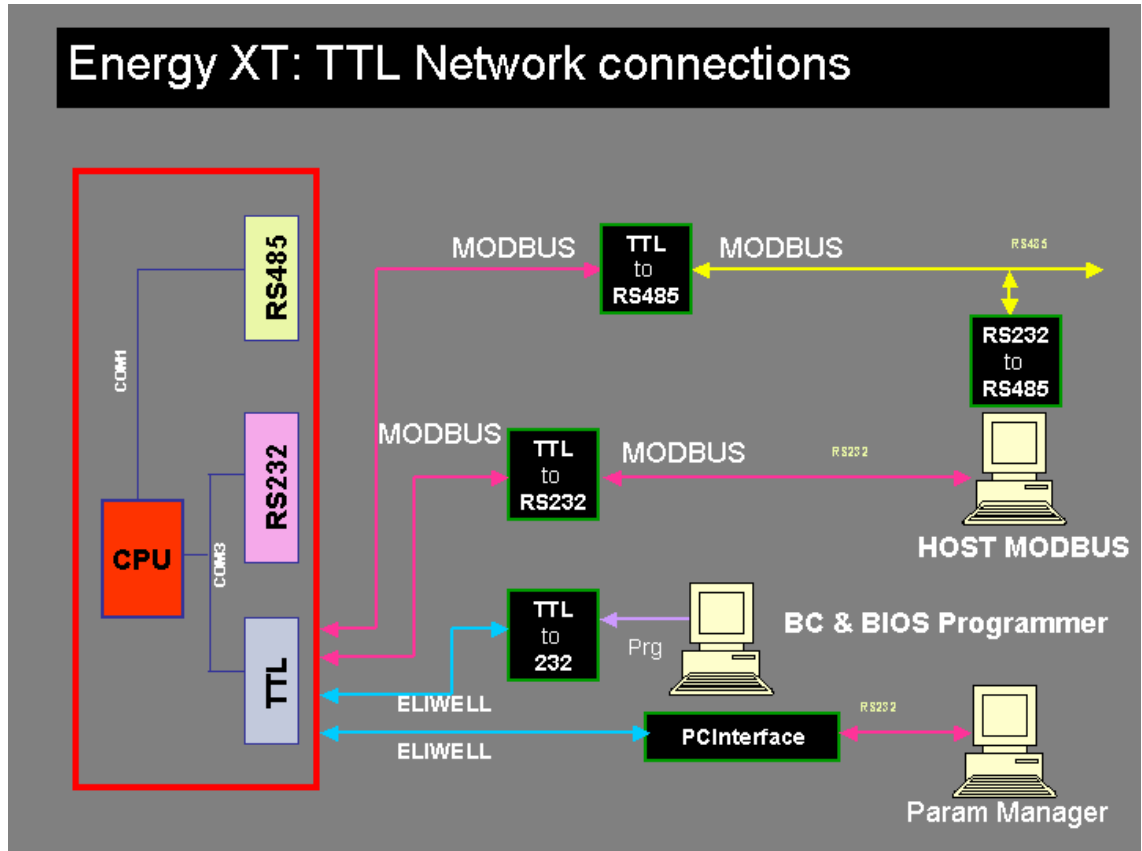

2.2.6 Remote RS232 topology

N.B.: The MODEM + *MODBUS* option implies *MODBUS/ASCII*

2.2.7 Local TTL topology

2.2.8 SUB-D 9 poles MALE of Energy XT

*SUB-D 9 poles MALE of Energy XT
(standard RS232 interface)*

The pin-out of the connector for the standard RS232 is represented below:

Contact No	Code	Description
1	CD (or DCD)	Carrier Detect
2	RxD	Receive Data
3	TxD	Transmit Data
4	DTR	Data Terminal ready
5	GND	Signal Ground
6	DSR	Data Set ready
7	RTS	Request to send
8	CTS	Clear to Send
9	RI	Ring Indicator

The HW pins arranged for the EnergyXT application are marked in bold.
At present pin 8 CTS is not used, therefore the HW flow control is not currently available.

3 MODBUS FUNCTIONS AND RESOURCES

Modbus is a client/server communication protocol between devices connected on a network.

Modbus instruments communicate using a master-slave technique in which only one device (master) can send messages. The other devices on the network (slave) respond by returning the data requested by the master or by performing the action indicated in the message sent. A slave device is a device connected to the network that processes information and sends the results to the master using the *Modbus* protocol.

The master can send messages to individual slaves, or send messages to the whole network (broadcast), whereas the slave instruments respond to the messages individually and to the master device.

The *Modbus* standard used by Eliwell foresees the *use* of RTU coding for data transmission.

3.1 Data format (RTU)

The coding model used defines the structure of messages transmitted on the network, and the way in which this information is decoded. The type of coding is normally selected based on specific *parameters* (baud rate, parity, etc...), also, certain devices only support certain coding models, however it must be the same for all the instruments connected to a *Modbus* network.

The protocol uses the binary RTU method with the byte made up as follows:

8 data bits, parity bit even (not configurable), 1 stop bit.

N.B.: the transmission speed must be set to 9600 baud.

Setting the *parameters* allows the instrument to be fully *configurable*

They can be modified by means of:

- instrument keyboard
- sending the data using the *Modbus* protocol, directly to an individual instrument, or by broadcast, using address 0 (broadcast)

3.2 Modbus functions available and data areas

<i>Modbus</i> command	Command description
3	All consecutive registers in the same area are read (see <i>Parameters</i> Table)
16	All consecutive registers in the same area are written (see <i>Parameters</i> Table)

Product identification

The product in question can be univocally recognised using the hexadecimal Family (Release version values). Regarding the Energy XT product:

Example:

Fam/Ver: "C408" formed of Family Code C4 = 196 and version 08= 1

With *MODBUS* protocol it must be possible to :

Point	Information	<i>MODBUS</i> (*) command
1	Read / write <i>parameters</i> and/or variables	3/16
2	Read / write time bands	3/16
3	Read / write clock	3/16
4	Read alarms	3
5	Block output status updating by regulators	16
6	Read / write status of digital outputs	3/16
7	Read / write status of analogue outputs	3/16
8	Read analogue inputs – also see point 1 -	3
9	Read digital inputs – also see point 1 -	3
10	Read machine status (stand-by, heat, cool) and compressor status (selected, power, etc.)	3
11	Read / modify machine operating mode (heat, cool, etc.)	3/16
12	Read / modify machine ON/OFF status	3/16
13	Read / modify selection of compressors	3/16
14	<i>Read Alarm History</i>	20
15	Reset <i>Alarm History</i>	16
16	Reset alarms – also see point 4 -	16
17	<i>Read "Black Box"</i>	20
18	Reset <i>"Black Box"</i>	16
19	Password recognition to enable communication	16
20	Reading of FW/HW version	43

(*) also referred to as Function Code in Modbus terminology

Only the information obtainable via serial in **bold** in the previous table is always accepted by Energy XT in read.

The remaining information is accepted with different access levels by means of password using the serial command linked to **Password Recognition to enable communication**.

In particular:

- READ PASSWORD enabling read and write commands
- USER PASSWORD enabling read and write commands.
- ADMINISTRATOR PASSWORD enabling read and write commands (not modifiable by USER).

N.B.: on entering the ADMINISTRATOR password, all 3 passwords can be changed. Entering the USER password will only allow the USER and READ passwords to be changed.

IMPORTANT: See sub-section 8.1.1.4 Password

3.3 Address configuration

The address of a device within a *ModBus* message is made up of one byte and comprises:

- **MSB nibble:** family code = parameter **Cm01** (Family Address)
- **LSB nibble:** instrument address = Hardware address defined by DIP SWITCHES 2,3,4 (see section 2 UART serial ports in ENERGY XT and sub-section 8.1.1.2 Hardware Address)

INSTRUMENT CONFIGURATION PARAMETERS			
Par	<i>Modbus</i> address [DEC]	Description	Range
Cm01	39168	Family serial address	0...14
Cm24	39191	<i>COM1</i> (0,1,2,3) protocol type N.B.: To guarantee correct operation, the controller must be switched off and switched on again after modification of this	<i>COM1</i> serial protocol selection: 2= <i>Micronet</i> 3= <i>Modbus</i> /RTU
Cm25	39192	BAUD <i>COM1</i>	<i>COM1</i> serial baud selection: 0 = 9600 b/s 1 = 19200 b/s 2 = 38400 b/s
Cm26	39193	<i>COM1</i> parity	<i>COM1</i> parity selection 0 = none 1 = odd 2 = even
Cm27	39194	<i>COM3</i> (0,1,2,3) protocol type N.B.: To guarantee correct operation, the controller must be switched off and switched on again after modification of this parameter.	<i>COM3</i> protocol selection 0 = Televis 1 = Televis Modem 2 = <i>Micronet</i> 3 = <i>Modbus</i> /RTU 4 = <i>Modbus</i> /ASCII
Cm28	39195	BAUD <i>COM3</i>	<i>COM3</i> baud selection 0 = 9600 b/s 1 = 19200 b/s 2 = 38400 b/s
Cm29	39196	<i>COM3</i> parity	<i>COM3</i> parity selection 0 = none 1 = odd 2 = even
Cm30	39197	Data Length <i>COM3</i>	Selection 7/8 data bits <i>COM3</i>
Cm31	39198	Disable RTS <i>COM2</i>	0=normal management, 1=always high to supply RS232-RS485 external converters

3.4 Enabling configuration from serial

If you need access to *configuration* from the serial port to modify COLD *parameters*, switch the machine off and run an access procedure using the relevant address in the State area (see sub-section 8.1.1.5 Communication test in Area 5). You will have to enter a password (USER password is sufficient) as the procedure involves write commands. Data is read (with *modbus* command 3) then written (*modbus* command 16) to *modbus* address 14A described in the table below:

NP	Modbus Add [hex]	Description of element	VAL	Always readable	Writable only after password recognition
9	14A	<i>Enabling configuration from serial.</i> Used for writing COLD-type <i>parameters</i>	0:_NON_PUOI_RICHIEDERE_INGRESSO_IN_CONFIGURAZIONE_ (READ) (ENTRY TO <i>CONFIGURATION</i> NOT PERMITTED (READ)) 1:_AVVIA_SEQUENZA_PER_POTER_RICHIEDERE_CONFIGURAZIONE_ (WRITE) (START SEQUENCE TO OPEN <i>CONFIGURATION</i>) 2:_ATTENDI_PER_POTER_RICHIEDERE_INGRESSO_IN_CONFIGURAZIONE_ (READ) (WAIT TO OPEN <i>CONFIGURATION</i>) 3:_PUOI_RICHIEDERE_INGRESSO_IN_CONFIGURAZIONE_ (READ) (YOU CAN OPEN <i>CONFIGURATION</i> NOW) 4:_RICHIEDO_CONFIGURAZIONE_ (WRITE) (OPEN <i>CONFIGURATION</i>) 5:_SEI_IN_CONFIGURAZIONE_ (READ) (<i>CONFIGURATION</i> OPEN) 6:_ESCI_DALLA_CONFIGURAZIONE_ (WRITE) (EXIT <i>CONFIGURATION</i>)	X	X

The procedure to access *configuration* over the serial port is described below:

Send read command (command 3) to address 14A

If the value read = 0 : *configuration* cannot be accessed from the serial port, the machine may still be switched on (it must be switched off).

In this instance, a read command must be executed (command 16) with value = 1 to start the switch off machine sequence. At this point, repeat the read command as outlined in point 1.

If the value read = 3 : execute a write command (command 16) with value = 4 to request access to *configuration*. Then execute a read command (command 3): if the value read = value 5 then you have completed access to *Configuration* from Serial port.

To exit *configuration* from serial, write value 6 (command 16).

4 FUNCTIONS

4.1 “Black Box”

Function used to record machine operation status in a non-volatile memory in case of an event.

Label	Modbus address [DEC]	Black Box” parameters”	Description
Cm16	39952	Enable “Black Box”	Enable recording 0 = disabled 1 = enabled
Cm17	39953	Black Box” samples delay”	
Cm18	39954	Black Box” samples interval”	

The “Black Box” Function stores the machine status in case of an event.

Events that cause the collection or record to be stored in non-volatile memory are as follows:

- manual reset alarm;
- a bounded-type alarm changes from automatic to manual.

When a new event is being diagnosed, any other event is ignored until the collection has been stored.

Each save comprises a number of samples (equal to 20) taken with a frequency and a delay after the event defined by the parameters Cm17, Cm18.

4.1.1 Read “Black Box”

To read a “Black Box” event (or a collection of data saved by the above-mentioned function), Modbus protocol command 20 is used; instructions on how to use this command in the Energy XT application are provided below.

This command will read an entire data file; the data of several files in the same frame cannot be requested.

Black Box” reading frame structure”

	Byte Size	Value (Hex)	Description
Function Code	1	20 (0x14)	Fixed value indicating the modbus command
Byte Count	1	7	Fixed Value
Reference type	1	6	Fixed value
File Number	2	0...N_COLL	Code of Black Box Collection to be downloaded 0 = Collection in RAM i = n'th collection in Flash If N_COLL =1 downloading the oldest Collection is requested, therefore going towards more recent Collections as the N_COLL increases
Record Number	2	0...N_REC	Black Box record index: 0=reading of first record (synchronisation) 1...N_REC=reading of subsequent records
Record Length	2	61 (3D)	Fixed value equal to the Record size in words

NOTE: The first frame must have Record Number = 0 so that Energy XT can go to (synchronise) the first record of the file (of the selected Collection). Subsequent frames will have Record Numbers different from 0 indicating that resynchronisation is not required and that other records of the Collection can be sent (for any value, provided it is different from 0: by way of example, reading subsequent records of the same file could be an increasing number). If the Record Number is set at 0 during a download in progress, XT goes to the first record of the selected Collection.

Response frame structure

	Byte Size	Value (Hex)	Description
Function Code	1	20 (0x14)	Fixed value indicating the modbus command
Data Length	1	124 (0x7C)	Fixed Value
Sub-Req. X file resp. Length	1	123 (0x7B)	Fixed value
Sub-Req. X file Reference Type	1	6	Fixed value
Sub-Req. X record data Type	122		Data of record requested by sending the read frame (command 20) *

The following table describes the structure of the data contained in the last field given in the previous table (last field of the response frame)

1st byte	LEN	Number of data bytes actually belonging to the downloaded record, starting from the third byte. Subsequent data items are meaningless and therefore must not be considered
2nd byte	Code	0x00=End of Collection download 0x01=Good data, continue download 0xFB=No synchronisation 0xFC=Buffer tx not available (download in progress on other serial) 0xFD=Element read error 0xFE=Collection does not exist 0xFF=Collection empty
3rd byte		1st data item of record
...	
122nd byte		120th data item of record

4.2 Alarm History

System and regulation alarms generated are saved in a non-volatile FIFO memory queue that holds up to 99 elements.

New alarms generated are immediately entered in the [alarm history](#).

When the queue reaches 99 elements, new alarms will erase data for the oldest alarm.

The following data is stored for each alarm:

- alarm activation date and time in C-standard (long 32 bit) format;
- area is index of the alarm (refer to. [Parameters](#) section);
- Hourly frequency, i.e. number of times the alarm was generated during the hour (max. 32);
- Identification for system or regulation alarm;

If the alarm has already been recorded in the [alarm history](#), it occurred in the same hour, and the hourly frequency is less than 32, the hourly frequency is increased.

Modbus address [DEC]	Read Alarm History	Description
37120	Alarm history info : number of alarms present	
37121	Alarm history info : index of first alarm	
37122	Alarm history info : index of last alarm	

4.2.1 Read Alarm History

To read the [alarm history](#) (or one of the elements saved with this function), [Modbus](#) protocol command 20 is used; instructions on how to [use](#) this command in the Energy XT application are provided below.

Alarm History reading frame structure

	Byte Size	Value (Hex)	Description
Function Code	1	20 (0x14)	Fixed value indicating the modbus command
Byte Count	1	7	Fixed Value
Reference type	1	6	Fixed value
File Number	2	100	Alarm History code
Record Number	2	0...N_ELEM	Alarm History element index: 0=give me the first one (Synchronisation) otherwise=give me the following ones
Record Length	2	4	Fixed value equal to the Record size in words

NOTE: The first frame must have the Record Number = 0 so that Energy XT can go to the beginning of the [alarm history](#) list (oldest alarm). Subsequent frames will have Record Numbers different from 0 (any value, as long as it is different from 0: by way of example, reading subsequent records of the same file could be an increasing number) to indicate that synchronization is not requested and that other elements in the [alarm history](#) list can be sent (always the most recent ones).

If the Record Number is set at 0 during a download in progress, XT goes to the oldest alarm at that moment.

Response frame structure

	Byte Size	Value (Hex)	Description												
Function Code	1	20 (0x14)	Fixed value indicating the <i>modbus</i> command												
Data Length	1	10 (0x0A)	Fixed Value												
Sub-Req. X file resp. Length	1	9	Fixed value												
Sub-Req. X file Reference Type	1	6	Fixed value												
Sub-Req. X record data Type	8		Data of record requested by sending the read frame (command 20) <table border="1" data-bbox="753 555 1391 775"> <thead> <tr> <th>Byte no</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Alarm Number (decreasing)</td> </tr> <tr> <td>2-3-4-5</td> <td>Information on Day, Month, Year, Time coded according to standard "C"</td> </tr> <tr> <td>6</td> <td>Alarm code : Part 1</td> </tr> <tr> <td>7</td> <td>Alarm code : Part 2</td> </tr> <tr> <td>8</td> <td>Number of alarms in one hour</td> </tr> </tbody> </table>	Byte no	Description	1	Alarm Number (decreasing)	2-3-4-5	Information on Day, Month, Year, Time coded according to standard "C"	6	Alarm code : Part 1	7	Alarm code : Part 2	8	Number of alarms in one hour
Byte no	Description														
1	Alarm Number (decreasing)														
2-3-4-5	Information on Day, Month, Year, Time coded according to standard "C"														
6	Alarm code : Part 1														
7	Alarm code : Part 2														
8	Number of alarms in one hour														

NOTE: When responding to the request for the first element in the *alarm history* and the list is empty, the alarm number is 0xFF and the remaining data items are 0; on reaching the end of the list, the alarm number is 0 and the remaining data items are 0. While downloading, the alarm number is decreasing: starting from N (max. 99) which is the oldest element up to 1, the most recent element in the *alarm history*, or 0 if it is the last element (with all the remaining data 0). The response to the request for a history element without initial synchronisation has the value 0xFB in the Alarm Number field and all the other data items are 0. If a history element (not the first) is requested after the history has been completely read (alarm number 0), the response alarm number field will always be 0xFB and all the other data of the frame 0.

IMPORTANT: The colour of the ADDRESS column indicates addresses belonging to the same area.
Important: the relation between parameter descriptions and the associated string in Wizard are listed in the parameter table in the Energy XT Regulators manual.

5 TABLE OF PARAMETERS

IMPORTANT: The colour of the ADDRESS column indicates addresses belonging to the same area.

Important: the relation between parameter descriptions and the associated string in Wizard are listed in the parameter table in the Energy XT Regulators manual.

N.B.: The colour of the ADDRESS column indicates addresses belonging to the same area.

N.B.: [E2] indicates that the state/variable is saved in non-volatile memory.

7 COMANDI MODBUS PER LETTURA O SCRITTURA I/O

7.1 Commands 3 and 16

7.1.1 Sensor addresses with Modbus command 3 or 16

The return value of each individual sensor is a number that expresses the temperature or pressure measured in tenths. The range is from -32768 to +32767. If the sensor measures -32768, an error has occurred.

E.g. if sensor AI2 reads 245, it means that it has measured 24.5°C or 24.5°F depending on sensor parameter [configuration](#).

Modbus address		Sensor	Network
[DEC]	[HEX]		
192	00C0	AI1	XTM
193	00C1	AI2	
194	00C2	AI3	
195	00C3	AI4	
196	00C4	AI5	
197	00C5	AI6	
198	00C6	AI7	
199	00C7	AI8	
200	00C8	AI9	
201	00C9	AI10	
202	00CA	AI11	
203	00CB	AI12	
204	00CC	AI13	
205	00CD	AI14	
206	00CE	AI15	
207	00CF	AI16	

Modbus address		Sensor	Network
[DEC]	[HEX]		
208	00D0	AI1	XTEH1 XTEI1
209	00D1	AI2	
210	00D2	AI3	
211	00D3	AI4	
212	00D4	AI1	XTEH2 XTEI2
213	00D5	AI2	
214	00D6	AI3	
215	00D7	AI4	
216	00D8	AI1	XTEH3 XTEI3
217	00D9	AI2	
218	00DA	AI3	
219	00DB	AI4	
220	00DC	AI1	XTEH4 XTEI4
221	00DD	AI2	
222	00DE	AI3	
223	00DF	AI4	

Note that if you want to read probes associated to cards not configured as present in the XTM base, *Modbus* will respond with an exception command.

7.1.2 Digital input addresses with Modbus command 3 or 16

Instructions on how to monitor digital input states in a network that is the maximum network obtainable for a current XT system are provided below. The binary representation of the 16-bit registers read makes identifying the various digital inputs easy. Each bit contains the 1=excited or 0=not excited state for the relative digital input.

Network 1	
XTM	
XTEH1	
XTEH2	
XTEH3	
XTEH4	

		Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
<i>Modbus</i> address		Digital inputs															
[DEC]	[HEX]																
256	0100	IDL16	IDL15	IDL14	IDL13	IDL12	IDL11	IDL10	IDL9	IDL8	IDL7	IDL6	IDL5	IDL4	IDL3	IDL2	IDL1
257	0101	IDL2	IDL1	IDL8	IDL7	IDL6	IDL5	IDL4	IDL3	IDL2	IDL1	IDL22	IDL21	IDL20	IDL19	IDL18	IDL17
258	0102	IDL2	IDL1	IDL8	IDL7	IDL6	IDL5	IDL4	IDL3	IDL2	IDL1	IDL8	IDL7	IDL6	IDL5	IDL4	IDL3
259	0103	0	0	0	0	0	0	0	0	0	0	IDL8	IDL7	IDL6	IDL5	IDL4	IDL3

Network2 is a lesser network than Network1 but helps you to understand how to identify inputs in the event of a "mixed" network".

Network2	
XTM	
XTE1	
XTE2	
XTE3	
XTE4	

		Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
<i>Modbus</i> address		Digital inputs															
[DEC]	[HEX]																
256	0100	IDL16	IDL15	IDL14	IDL13	IDL12	IDL11	IDL10	IDL9	IDL8	IDL7	IDL6	IDL5	IDL4	IDL3	IDL2	IDL1
257	0101	IDL2	IDL1	IDL4	IDL3	IDL2	IDL1	IDL4	IDL3	IDL2	IDL1	IDL22	IDL21	IDL20	IDL19	IDL18	IDL17
258	0102	0	0	0	0	0	0	0	0	0	0	IDL4	IDL3	IDL2	IDL1	IDL4	IDL3

Note that if you want to read digital inputs associated to cards not configured as present in the XTM base, *Modbus* will respond with an exception command if the digital inputs concerned are the only ones in the register read. If there are digital inputs in the register associated to cards configured as present, the state of the "non-configured" inputs will be 0.

7.1.3 Analogue output addresses with Modbus command 3 or 16

Instructions on how to monitor analogue output values in a network that is the maximum network obtainable for a current XT system are provided below. The representation with the most significant (Bit15...Bit8) and least significant (Bit7...Bit0) byte of the 16-bit registers read makes identifying the various analogue outputs easy. Each byte contains the percentage value of the analogue output indicated. Therefore the value of the two bytes forming each register can go from 0 (corresponding to 0% of the analogue output) to 100 (corresponding to 100% of the analogue output).

Network 1		Modbus address		Analogue outputs	
		[DEC]	[HEX]	Bit15...Bit8	Bit7... Bit0
XTM					
XTEH1					
XTEH2		576	0240	AO2	AO1
XTEH3		577	0241	AO4	AO3
XTEH4		578	0242	AO2	AO1
		579	0243	AO2	AO1
		580	0244	AO2	AO1
		581	0245	AO2	AO1

Network2 is a lesser network than Network1 but helps you to understand how to identify inputs in the event of a "mixed" network".

Network2		Modbus address		Analogue outputs	
		[DEC]	[HEX]		
XTM					
XTE1					
XTE2		576	0240	AO2	AO1
XTE3		577	0241	AO4	AO3
XTE4					

Note that if you want to read analogue outputs associated to cards not configured as present in the XTM base, *Modbus* will respond with an exception command.

7.1.4 Digital output addresses with Modbus command 3 or 16

Instructions on how to monitor digital output states in a network that is the maximum network obtainable for a current XT system are provided below. The binary representation of the 16-bit registers read makes identifying the various relays easy. Each bit contains the ON=1 or OFF=0 state of the respective digital output.

The Mixed Network is obtained through a combination of XT and expansions with less inputs and outputs than the MaxNetwork, but which helps you to understand how to identify digital outputs in the event of a "mixed" network".

Mixed Network

XTM
XTE1
XTE2
XTE3
XTE4

Modbus address		Digital outputs															
[DEC]	[HEX]																
512	0200	NO16	NO15	NO14	NO13	NO12	NO11	NO10	NO9	NO8	NO7	NO6	NO5	NO4	NO3	NO2	NO1
513	0201	NO3	NO2	NO1	NO9	NO8	NO7	NO6	NO5	NO4	NO3	NO2	NO1	NO20	NO19	NO18	NO17
514	0202	NO1	NO9	NO8	NO7	NO6	NO5	NO4	NO3	NO2	NO1	NO9	NO8	NO7	NO6	NO5	NO4
515	0203	0	0	0	0	0	0	0	0	NO9	NO8	NO7	NO6	NO5	NO4	NO3	NO2

Note that if you want to read digital outputs associated to cards not configured as present in the XTM base, *Modbus* will respond with an exception command if the digital outputs concerned are the only ones in the register read. If there are digital outputs in the register associated with cards configured as present, the state of the "non-configured" outputs will be 0.

8 APPENDICE

8.1 Troubleshooting

8.1.1 No Modbus communication

If *Modbus* communication has failed with Energy XT, check the settings required to restore communication. A list of instructions is provided below outlining how best to check for potential errors in instrument settings.

Setting *COM1 configuration parameters*

RS-485 *COM1* serial port operation depends on the status of the 3 dedicated *parameters* **Cm24**, **Cm25** and **Cm26**:

Label	Modbus address [DEC]	PARAMETERS COM1 AND COM3	Description
Cm24	39191	COM1 type protocol	COM1 serial protocol selection: 2= <i>Micronet</i> 3= <i>Modbus/RTU</i>
Cm25	39192	BAUD COM1	COM1 serial baud selection: 0 = 9600 b/s 1 = 19200 b/s 2 = 38400 b/s
Cm26	39193	COM1 parity	COM1 parity selection 0 = none 1 = odd 2 = even

Make sure that the first 2 *parameters* are set as indicated below:

Cm24 = 3 (Modbus/RTU)

Cm25 = 0 (9600 b/s)

IMPORTANT! The *COM1* parity parameter **Cm26** must be consistent with the parity set in the software to be adopted: **if Cm26=0 then 2 parity bits must be set on the master communicating with XT.**

Hardware address

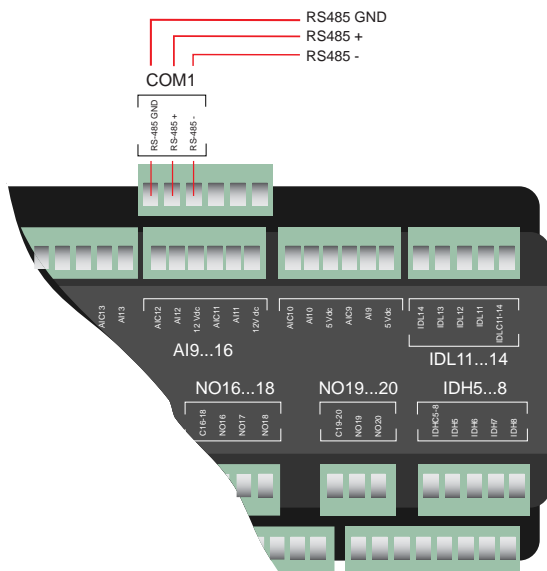

The software and hardware addresses must be the same. To ensure this, make sure DIP SWITCHES are set as follows:

IMPORTANT: To set the hardware address to "1", only the second dip switch from the left needs to be at the bottom.

Polarity and Position of port *COM1*

Check the correct position of serial port *COM1*

Passwords

The password must be communicated to Energy XT from a PC to enable the user for communication. An error entering the password may block communication. There are three different types of password in Energy XT:

- READ PASSWORD enabling read commands only (when “blank” read is always enabled)
- USER PASSWORD enabling read and write commands.
- ADMINISTRATOR PASSWORD enabling read and write commands (not modifiable by USER).

All passwords have 10 characters. The default password set by Eliwell has 10 “empty spaces”, meaning that Energy XT serial communication can be enabled by entering a *modbus* write command (command 16) comprising a string of 10 “empty spaces”.

IMPORTANT! Sending the password enables the communication at first entering; the password must be re-entered to disable the communication.

As described above, serial communication is enabled by entering a string parameter, i.e. the password, but this **enabling of communication is saved in RAM and not EEPROM**. This means that, for example, if power is cut off to Energy XT after the password has been entered and serial communication enabled, when power is returned serial communication will once again be disabled. Hence the password will have to be re-entered to restore serial communication.

Area 5 communication test

If you are unable to establish if your PC is actually communicating with Energy XT, we advise you test a particular address area (area 5, STATE area) which, being unprotected by a password, can be read via *modbus* command. So enter a read command (*modbus* command 3) for the STATE area (area 5).

The structure of the STATE area (area 5) and relevant *modbus* addresses that you'll need to run a read command used for a “communication test” are described below.

NP	Modbus Add [hex]	Description of element	VAL	Always readable	Writable only after password recognition	
1	142	Info if <i>parameters</i> have been modified	0: not modified (READ) 0: reset flag (WRITE) 1: modified (READ)	X	X	
2	143	Info presence of active alarms	0: not present 1: present	X	X	
3	144	Info if Historic is full	0: not full 1: full	X	X	
4	145	Info if the Black Box is full	0: not full 1: full	X	X	
5	146	Machine switch On/Off	0: off (READ/WRITE) 1: on (READ/WRITE) 2: switch Off (READ) NOTE: If Off is requested, switching off cannot be interrupted	X	X	
6	147	Update of output state blocked by regulators and input states by drivers.	0: Unlock outputs, always carried out + reset Lock Timeout 1: Lock outputs, carried out only if Lock Timeout is different from 0	X	X	
7	148	Lock Timeout	Time in seconds (max. 600 sec) NOTE: when equal to 0, any Lock is not reset	X	X	
8	149	Compressor selection/deselection	Bit3	SELECT/DESELECT COMPRESSOR No. 1	X	X
			Bit3	SELECT/DESELECT COMPRESSOR No. 2		
			Bit3	SELECT/DESELECT COMPRESSOR No. 3		
			Bit3	SELECT/DESELECT COMPRESSOR No. 4		
			Bit3	SELECT/DESELECT COMPRESSOR No. 5		
			Bit3	SELECT/DESELECT COMPRESSOR No. 6		
			Bit3	SELECT/DESELECT COMPRESSOR No. 7		
			Bit3	SELECT/DESELECT COMPRESSOR No. 8		
9	14A	<i>Enabling configuration from serial port. Used for writing COLD-type parameters</i>	0: NON PUOI RICHIEDERE INGRESSO IN CONFIGURAZIONE_ (READ) (ENTRY TO CONFIGURATION NOT PERMITTED (READ)) 1: AVVIA SEQUENZA PER POTER RICHIEDERE CONFIGURAZIONE_ (WRITE) (START SEQUENCE TO OPEN CONFIGURATION) 2: ATTENDI PER POTER RICHIEDERE INGRESSO IN CONFIGURAZIONE_ (READ) (WAIT TO OPEN CONFIGURATION) 3: PUOI RICHIEDERE INGRESSO IN CONFIGURAZIONE_ (READ) (YOU CAN OPEN CONFIGURATION NOW)	X	X	

NP	Modbus Add [hex]	Description of element	VAL	Always readable	Writable only after password recognition
			4: RICHIEDO_CONFIGURAZIONE_ (WRITE) (OPEN <i>CONFIGURATION</i>) 5: SEI_IN_CONFIGURAZIONE_ (READ) (<i>CONFIGURATION</i> OPEN) 6: ESCI_DALLA_CONFIGURAZIONE_ (WRITE) (EXIT <i>CONFIGURATION</i>)		
10	14B	Operating mode	1 = CHILLER 2= CHILLER+RECOVERY (enabled but not necessarily activated) 3 = HEAT PUMP 8 = CHILLER+FREE COOLING (enabled but not necessarily activated) NOTE: The operating mode in write (change) works with the same priorities as the manual mode change. In read, the code of the current machine modus operandi at that moment (which must be different from the one requested, for reasons of time band and mode change digital input priority) is supplied.	X	X

9 RESPONSABILITÀ E RISCHI RESIDUI

Eliwell Controls s.r.l. shall not be liable for any damages deriving from:

- installation/*use* other than that prescribed which does not comply with the safety standards specified in the regulations and/or herein;
- *use* on equipment that does not guarantee adequate protection against electric shock, water or dust when assembled.
- *use* on equipment that allows dangerous parts to be accessed without the *use* of tools;
- Installation/*use* on equipment that is not compliant with the standards and regulations in force.

10 DECLINAZIONE DI RESPONSABILITÀ

This document is exclusive property of **Eliwell Controls srl.** and cannot be reproduced and circulated unless expressly authorized by **Eliwell Controls srl**

Although all possible measures have been taken by **Eliwell Controls srl l.** to guarantee the accuracy of this document, it does not accept any responsibility arising out of its *use*.
